Coronal Holes – 6 OCT 2026

Analysis

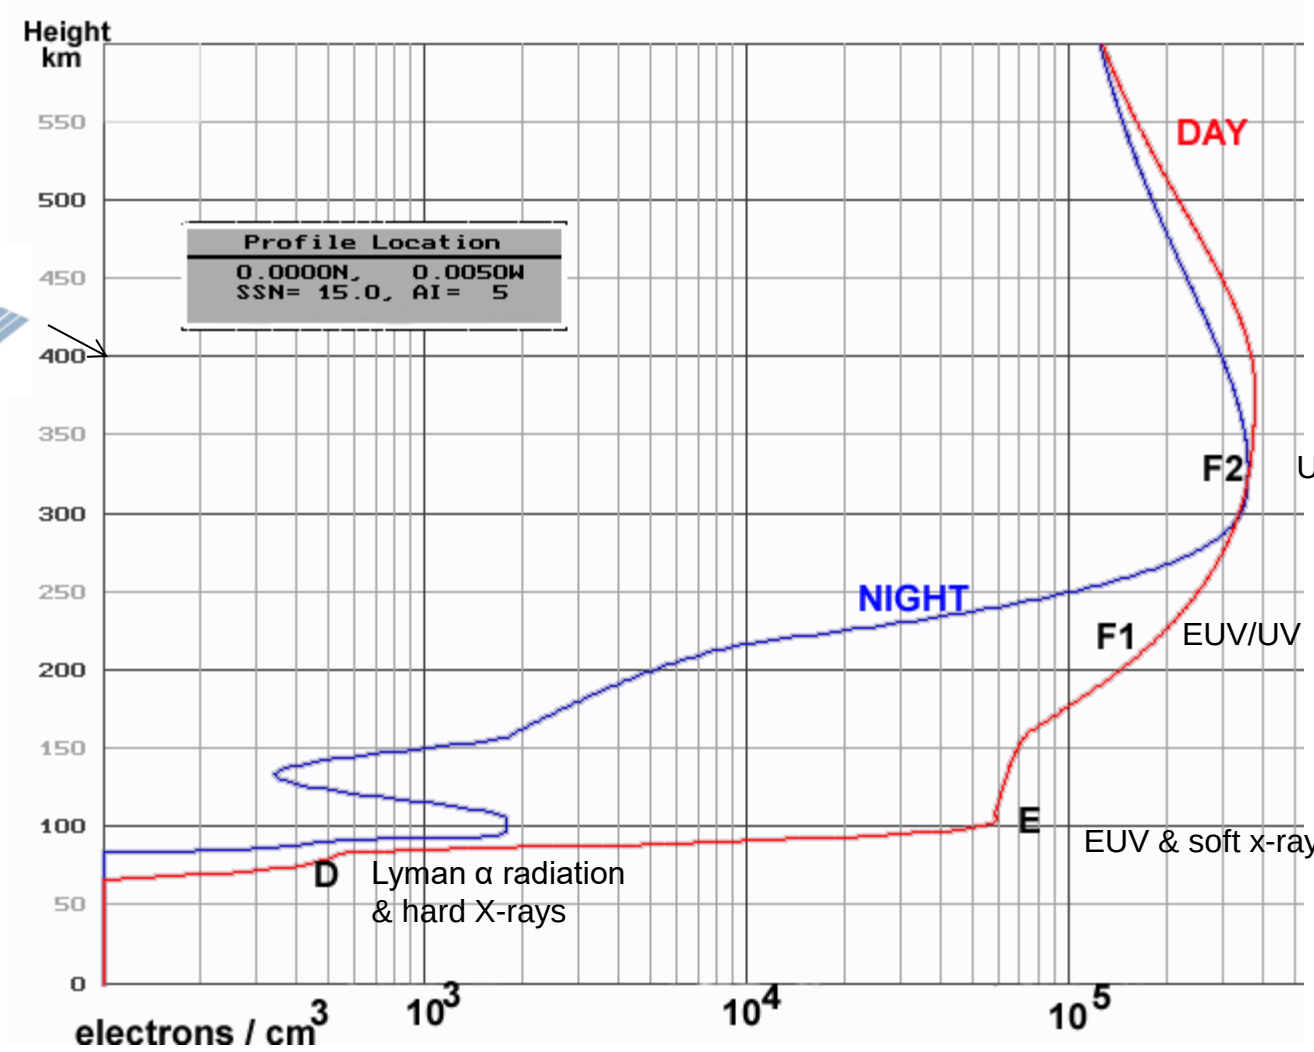

Coronal hole #98 is now turning away from Earth.

Coronal hole #99 will be monitored as it rotates across the disk.

Austin Ionosonde Status

- GIRO is presently providing only GAMBIT models for both Austin and Eglin Ionosonde but these foF2 models appear to be accurate, based on MARS net performance (Critical Frequency).

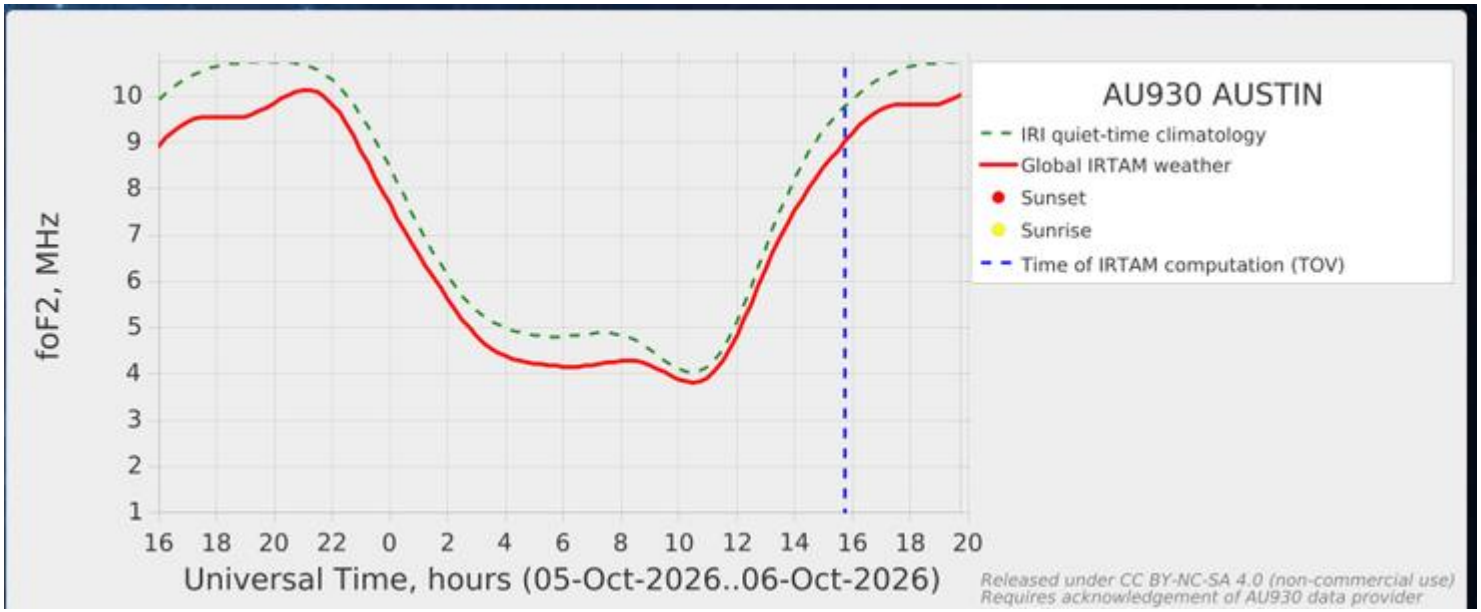

GAMBIT foF2 Trending Chart for Eglin Ionosonde

https://www.region6armymars.org/resources/solarweather.php

GAMBIT foF2 Trending Chart for Austin Ionosonde – Model only

https://www.region6armymars.org/resources/solarweather.php

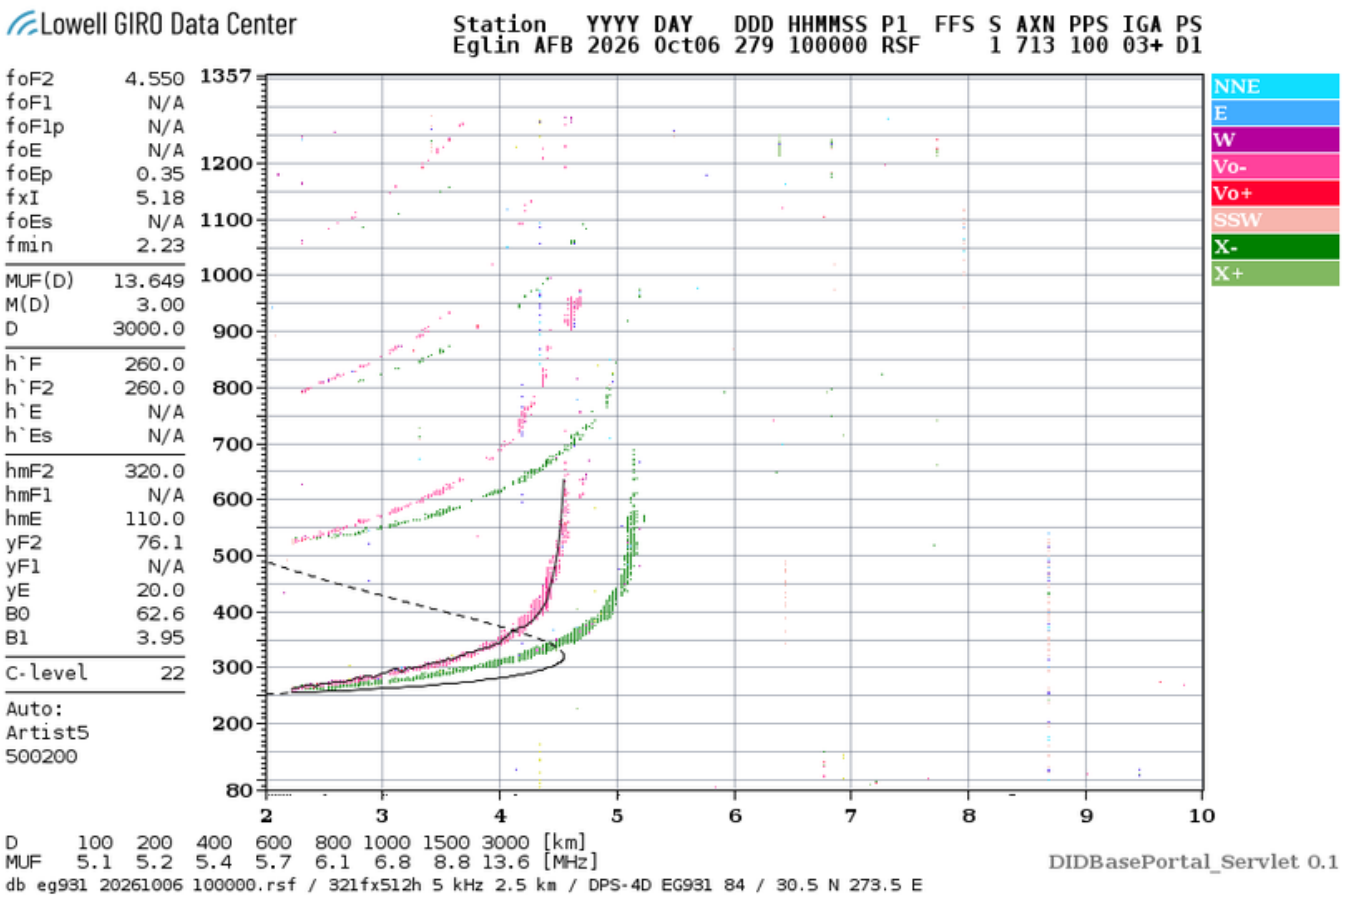

Use of GIRO DIDBASE

https://giro.uml.edu/didbase/

Eglin Ionosonde – 1000 UTC

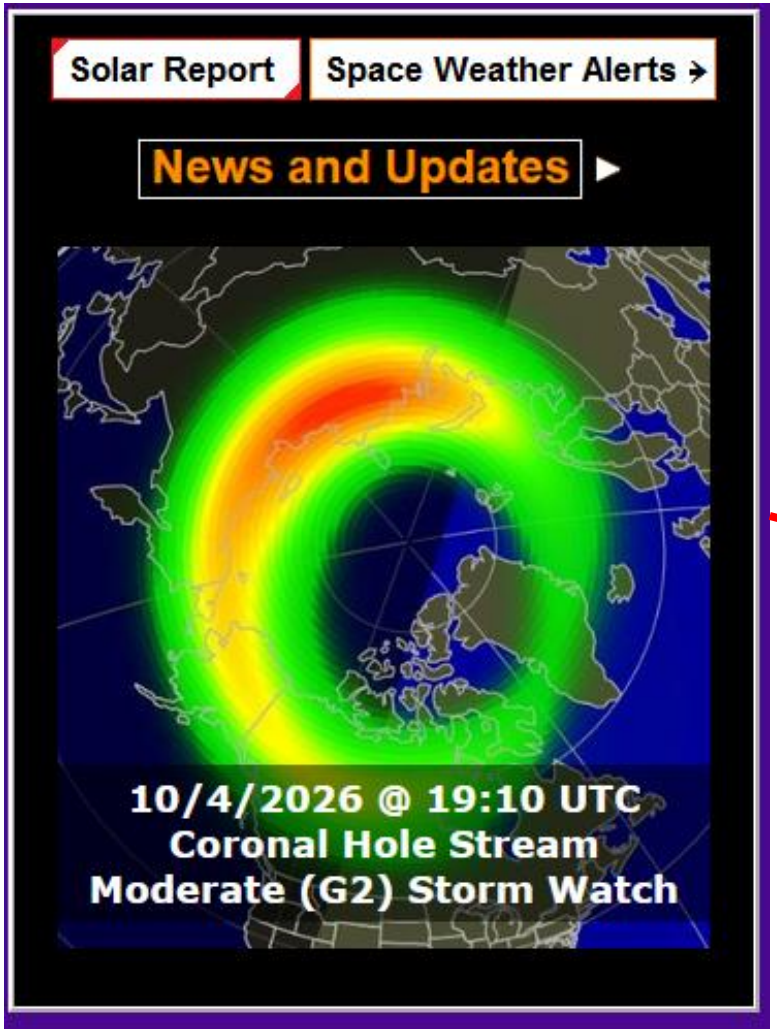

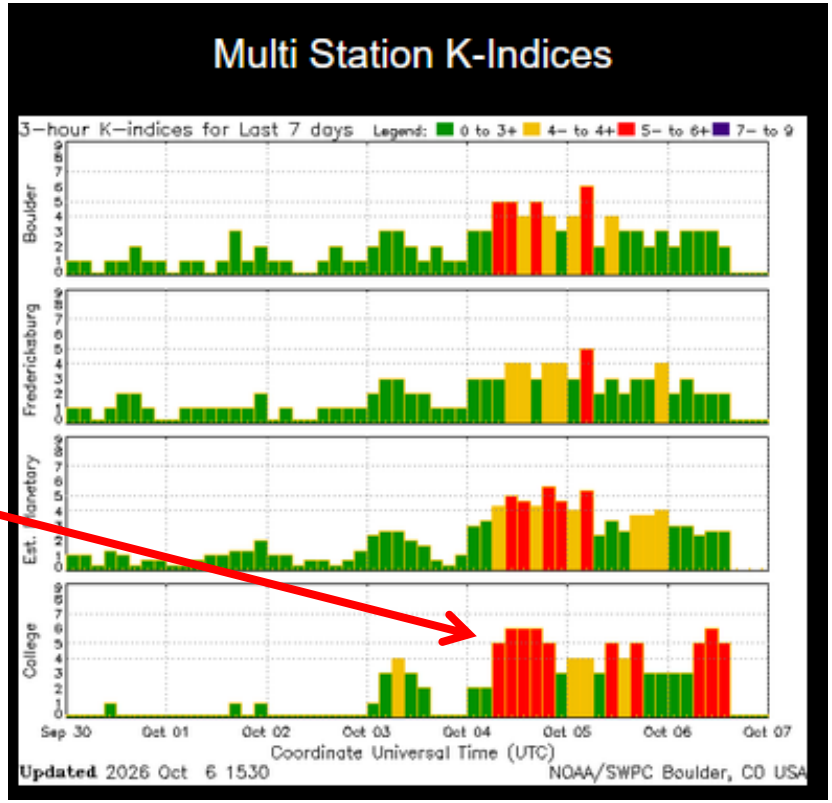

Time Shift for Eglin Ionosonde

- Eglin AFB Ionosonde is east of Austin at about the same Latitude so sun angle is about the same (same solar insolation).
- What happens to the Ionosphere over Eglin will occur over Austin about 45 minutes later.
- This is simply a Longitude difference converted to time.
- So look at Eglin's foF2 45 minutes earlier to see what is going to happen over Austin.
- The most rapid change in foF2 occurs as the sun is rising and setting (morning and evening).

FLYING TO THE VOLCANO: Iceland's Geldingadalur volcano has turned into an popular tourist attraction---especially since auroras were sighted above the glowing lava. Early this morning, Tuesday, April 6th, Brian Emfinger saw auroras before he even reached the Reykjanes peninsula:
